

Thirty Musts for Meaning Banking

Johan Bos & Lasha Abzianidze

1 Look at other meaning banks!

English Resource Grammar

Damon showed me
his stamp album.

x1 x2 e1 t1

male.n.02(x1)

Name(x1, damon)

time.n.08(t1)

t1 < now

show.v.04(e1)

Time(e1, t1)

Recipient(e1, speaker)

Theme(e1, x2)

Agent(e1, x1)

stamp_album.n.01(x2)

Owner(x2, x1)

2 Select public domain corpora!

qt leap

QA@CLEF-2004

TED

anc
AMERICAN
NATIONAL
CORPUS

CRPUS

TATOEBA

BETA
project

3 Freeze the corpus before you start!

4 Work with raw texts in your corpus!

- words \neq atoms of meaning
- tokenisation decisions can change
- never carry out annotation on tokenised text
- don't think "syntax" can fix word boundaries

New York-based companies ...

5 Use stand-off annotation!

- keep annotations separate from original
- use character offsets of original (raw) text
- effective if various annotation layers are involved

6 Consider manual annotation!

- Many meaning banks are created with the help of a computational grammar (ERG, CCG)
- But there is an alternative:
manually produce
meanings (AMR)

```
(b/base-01
  :ARG0 (c/company
    :Location (c/city
      :Name (n/name
        :Op1 "New"
        :Op2 "York"))))
```

7 Make a friendly annotation interface!

- Annotation can be fun – but also tedious
- Web-based, search facilities, statistics
- Sanity checker

8 Include an issue reporting system!

- Annotators will find bugs, raise questions, observe interesting phenomena
- Provide means to record this valuable information
- There are several existing issue reporting systems available (e.g., MANTIS)

9 Be careful with the crowd!

- **Gamification:**

PHRASE DETECTIVES

slow and hard to recruit new players

- **Crowdsourcing:**

payment and dealing with cheaters

wordrobe

play what you mean

10 Profit from lexicalised grammars!

- A lexicalised grammar (e.g. CCG) gives an advantage in annotating syntactic structure
- Thematic roles can be directly coupled to lexical entries (words)

Amy loves Bob .
NP (S\NP)/NP NP S\S
[Stim,Exp]

29 Don't focus on just one language!

- Most meaning banks: one language (English)
- Risky!
- Meanings ought to be abstract (language neutral)
- Parallel corpora!

11 Try to use language-neutral tools!

- Tokenisers, taggers, parsers, boxers
- Resources tailored to a particular language ...
- ... prevent porting your method to other languages

elephant

12 Apply normalisation to symbols!

Expression	Meaning
2pm	14:00
half past eight	08:30
five to ten	09:55

Expression	Meaning
forty five	45
two hundred	200
367	367

13 Limit underspecification!

- Underspecification hinders inference
- Provide most plausible interpretation

Tom got stuck in his sleeping bag.

sleeping_bag.n.01(x)

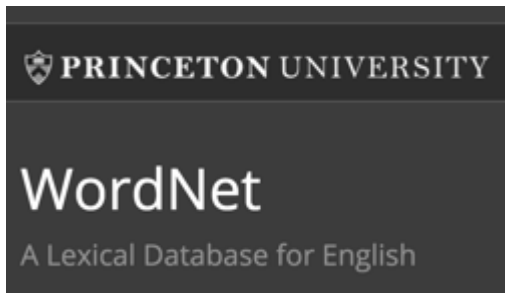

zzzz

bag.n.01(x)
sleep.v.01(e)
Agent(e,x)

14 Beware of annotation bias!

- Most plausible interpretation can also give unfair balance to stereotypes
- Examples:
 - gender
 - word sense

15 Use existing resources for word senses!

BabelNet

**Global
WordNet
Association**

16 Apply symbol grounding!

- words → concepts
- named entities → wikification (AMR)
- toponyms → GPS coordinates
- visualisation of concepts or actions
- creating timelines

17 Adopt neo-Davidsonian events!

- *Davidson* $\text{eat}(e,x)$ $\text{eat}(e,x,y)$
- *Hobbs* $\text{eat}(e,x,y,z)$
- *Parsons* $\text{eat}(e)$ $\text{Agent}(e,x)$ $\text{Patient}(e,y)$

18 Use existing role-labelling inventories!

- PropBank: small set (6) of universal roles
- VerbNet: larger set (ca. 25) of universal roles
- FrameNet: specific roles for each frame

Also needed: relations for
prepositions, noun compounds, possessives

19 Treat role nouns differently!

- agent and recipient nouns are relational (*worker, employee, victim, dentist*)
- treating them as one-place predicates gives rise to contradictions
- AMR and PMB pursue this approach

(Mia's husband is Vincent's boss)

20 Beware of geopolitical entities!

- Names for GPEs can refer to locations, governments, sport squads, people
- Systematic polysemy:
cities, states, countries, continents, etc.
- See ACE annotation guidelines

21 Give scope to negation!

- sentence meaning is about truth conditions
- *negation* plays a crucial role here
- proper treatment requires scope: $\neg(\dots)$

(concord, affixes, raising)

22 Pay attention to compound words!

Expression	Meaning
hard hat	hard_hat.n.02(x)
peanut butter	peanut_butter.01(x)
old woman	old_woman.n.01(x) ???
secretary of state	secretary_of_state.n.01(x)
North and South Dakota	state.n.01(x) &Name(x, North_Dakota) & ...
Jingle Bells	song.n.01(x) & Name(x, Jingle_Bells)

Lucy in the Sky with Diamonds

Several Species of Small Furry Animals Gathered Together in a Cave and Grooving With A Pict

23 Use inference tests in design!

- Amy is a smart woman $\xrightarrow{\text{yes}}$ Amy is a woman
Amy is ten years old $\xrightarrow{\text{no}}$ Amy is old

23 Use inference tests in design!

- Amy is a smart woman $\xrightarrow{\text{yes}}$ Amy is a woman
Amy is ten years old $\xrightarrow{\text{no}}$ Amy is old
- Bob is unhappy $\xrightarrow{\text{yes}}$ Bob is not happy
Bob is not happy $\xrightarrow{\text{no}}$ Bob is unhappy

23 Use inference tests in design!

- Amy is a smart woman $\xrightarrow{\text{yes}}$ Amy is a woman
Amy is ten years old $\xrightarrow{\text{no}}$ Amy is old
- Bob is unhappy $\xrightarrow{\text{yes}}$ Bob is not happy
Bob is not happy $\xrightarrow{\text{no}}$ Bob is unhappy
- Florence is the cultural capital of Italy $\xrightarrow{\text{no}}$
Florence is the capital of Italy

24

Divide and conquer!

- computing meaning is very hard
- many unsolved representation problems
 - aspect
 - information structure (focus)
 - presuppositions
 - generics
 - plurals

25 Put complex presuppositions on hold!

- some presuppositions triggers can be analysed as being anaphoric (definites, names)
- but more complex cases require copying or other sophisticated operations

(the crowd applauded again)

26 Respect elliptical expressions!

- Invisible, but omnipresent...
- Many different types of ellipsis

My hair is longer than Mary's ∅.

Tom eats fish, but his brother doesn't ∅.

∅ Ho fame.

27

Think about generics!

- generics, habituals, kinds
- hard to model in first-order representations

A lion is strong.

Who invented the typewriter?

I play the piano.

28

Don't try to *be* clever!

The fork **is** on the table.

Mary **is** an engineer.

John **is** the teacher who graded my essay.

 PRINCETON UNIVERSITY

WordNet

A Lexical Database for English

30 Measure meaning discrepancies!

- Need to be able to compare meaning representations
- Current approaches based on Allen et al. 2008 (Smatch for AMR, Counter for DRS)
- We need to make “matching” more semantical

The End

pmb.let.rug.nl
